

The **Two-Minute Exam** That Could Save Your Life

As seen on
"The Doctors" and "Dr. Oz"

70% of oropharyngeal
cancer cases are caused by **HPV**

How many little sores do we find in our mouths? Dozens? Hundreds? More? Most of the time we ignore them, and they simply go away. But sometimes our mouths keep secrets. That's why we use the VELscope Enhanced Oral Assessment system.

Request
an **oral**
screening
from your
dentist!

The **VELscope**

- Improves our assessment of your overall oral health.
- Helps ensure that the delicate tissues of your mouth are healthy.
- Helps protect you from oral disease, including oral cancer.

All this in **two minutes**, with no rinses, stains or discomfort.

Our dental office is proud to provide the most advanced standards of care available. Please ask us about a **VELscope exam**.

Early Detection Matters

Why the VELscope?

- Helps dental professionals find oral mucosal abnormalities, including oral cancer
- Over 10,000,000 examinations performed
- Recognized by the World Health Organization

Regular Oral Screenings Could Save Your Life

"Adding the VELscope to our diagnostic protocol has been extremely useful and resulted in detection of dangerous lesions that would have otherwise been undetected."

– Edmond L. Truelove DMD, MSD,
Former Chair & Professor Oral Medicine,
School of Dentistry, University of Washington

Oral Disease & Oral Cancer

The VELscope helps us find oral disease early, including precancer and cancer, when it's easier to treat.

One of the VELscope's most important tasks is to help locate areas that might, if not treated, progress to oral cancer.

Oral cancer's 5-year relative survival

Found early: good, approx. 85%	Found late: poor, approx. 40%
--------------------------------------	-------------------------------------

Finding oral cancer in its early stages is key to survival.

Major Risk Factors

Tobacco and alcohol use
Age (40+)
HPV infection

How Does it Work?

- The VELscope's blue light stimulates natural fluorescence in the soft tissues of your mouth
- Natural fluorescence, seen through the VELscope, helps dental professionals to see disease not visible with the naked eye
- The VELscope can help dentists discover oral disease BEFORE it can be seen under ordinary light

"I was young, healthy, thriving. I had no signs of Oral Cancer. I came to find out, most of us are at risk. Thankfully, I got screened and it saved my life."

– Amber Young
Oral Cancer Survivor
